(a) Sampling near the boundary
Failure region
Target samples
Proposal samples
X_1
X_2
(b) The target and proposal differ
Target $p(s)$
Proposal $q(s)$
$\beta = 3.5$
Density
Standardized demand S
(c) Median and middle 80% of runs
$\times 10^{-3}$
Ordinary MC
Importance sampling
Exact value
Estimated probability
Samples N
(d) Same rate, lower variance
Ordinary MC
Importance sampling
Relative RMSE
Lines: exact RMSE
Markers: 64-run estimates
Samples N
